

ABSTRACT

The carton of this invention is capable of carrying the plurality of containers stacked upon their ends in two tiers with a unique dispenser that permits the dispensing of containers on their sides. The dispenser is formed in a top side wall and extends into the end wall with most of the end wall being torn open but leaving a portion near the bottom side wall to prevent the bottom layer of containers from rolling out. Angled projections in the dispensing end of the carton near the top panel and bottom panel prevent the top layer of containers from rolling out. A divider is provided to facilitate loading the two tiers of containers and an end of the divider is folded down to facilitate its correct placement on the bottom tier of cans. A slit is provided between the two end portions of the divider so cans can be removed from the dispenser without being impeded by the divider being in the way.
